Report 1: Project Description Report

Course: UML Class Diagram Modelling | Instructor: Eric Maniraguha | Institution: Kigali Independent University (ULK)
Group: Mugisha Alain Paisible & MUCUNGUZI Felix | Date: 20 October 2026

1. Project Title and Business Idea

Hotel Booking System. A mid-sized hotel needs an information system to manage rooms, guests, reservations and payments instead of paper registers and phone calls.

2. Problem Statement and Purpose

Manual booking causes double bookings, lost records, slow check-in and difficulty tracking payments and room availability. The purpose of the proposed system is to centralise hotel data so that staff can quickly check availability, register guests, confirm bookings, record payments and produce reports.

3. Project Scope

Covered:

- Guest registration and profile management
- Room and room type management (price, capacity, status)
- Searching for available rooms by date
- Creating, confirming, cancelling bookings; check-in and check-out
- Recording payments and receipts
- Staff roles and basic booking reports

Excluded:

- Online payment gateway integration
- Restaurant, spa and event-hall management
- Payroll and accounting for staff
- Full application development (this project is design only, using a UML class diagram)

4. Main Classes and Responsibilities

Class	Responsibility
Hotel	Represents the hotel; owns its rooms and employs its staff.
RoomType	Defines a category of room (Single, Double, Suite) with price and capacity.
Room	A physical room that can be booked.
Guest	A customer who registers and books rooms.
Booking	A reservation of one room by one guest for a date range.
Staff	Hotel employee who manages bookings and guest check-in/out.

Payment	A payment made for a booking (cash, mobile money, card).

5. System Requirements

Functional:

- The system shall register and update guests.
- The system shall show rooms available between two dates.
- The system shall create, confirm and cancel bookings and calculate the total amount.
- The system shall record payments (cash, mobile money, card) and print receipts.
- The system shall let staff check guests in and out and generate reports.

Non-functional:

- Simple interface usable by reception staff with little training.
- Data stored securely with role-based access.
- Fast response when searching availability.
